SUMMARY

I am an Applied Scientist at Adobe, where I train and evaluate multimodal language models for creative work. The work often hinges on subjective quality, like whether a photo edit looks better or a story feels original, so I spend as much time building evaluations I trust as training the models. I have shipped this work in Adobe GenStudio and published it at CVPR, ICML, and AAAI workshops.

EXPERIENCE

Applied Scientist – Adobe Inc. (Unified Platform), San Jose, CA June 2021 – Present

Vision-Language Model Training & Evaluation

- Led **ATune** (under review): a 54M-parameter model that learns photo retouching from 10M unedited stock photographs and drives off-the-shelf editors through their sliders. In a study with 157 raters, its edits beat GPT-6 Astra on the same editor (**54.3%** of 3,524 votes, 95% CI 50.3–58.3) and tied with Claude Opus 5.
- Fine-tuned **Gemma-3-12B** with LoRA to score marketing-image quality, training on 8× H100 (DDP, BF16, FlashAttention-2, Liger kernels).
- Grounded VLM quality reasoning in 14+ computed pixel-level metrics (sharpness, exposure, color balance); the resulting interpretable scorer reaches **Pearson r** $\approx$ **0.88** (MAE 0.77) vs. zero-shot GPT-5.4 (MAE 1.34) and Claude Opus 4.7 (MAE 1.95).
- Built the **MQCore** evaluation benchmark and a fault-tolerant async annotation pipeline (100+ images/min) for the 700K-image KADIS image-quality dataset.

Evaluation Research & Benchmarking

- First author of **DistortBench** (CVPR 2026 Workshop): a 13.5K-question benchmark over 27 distortion types and 5 severity levels. Evaluated 18 VLMs with bootstrap confidence intervals; the best model (Qwen3.5-27B) scores **61.9%** (chance 25%), above the average annotator (60.2%) and within the 95% CI of a 3-annotator majority vote (65.7%, CI 59.4–71.5).
- Co-authored **JudgeBreak** (ICML 2026 Workshop): across 95 subjective evaluation settings, linear probes on Qwen3-32B hidden states with cross-validated layer selection reach **78.1%** mean pairwise accuracy vs. 70.1% for the strongest baseline (the best reward model or a zero-shot GPT-5.4 judge).
- Co-authored a curiosity-driven **LLM-as-a-judge** (AAAI 2026 Workshop, Oral) that personalizes creative-writing evaluation by modeling the judge's surprise at each expert's explanation, improving F1 by 23% and correlation by 38% over an SFT baseline.

Production Multimodal Systems & Agents

- Built the first prototype of **Adobe GenStudio for Performance Marketing** (launched October 2024, now serving Fortune 500 clients including Microsoft and AT&T), then designed its multimodal brand service (VLM content validation, brand-DNA extraction, retrieval), deployed in 3 regions.
- Built a **multimodal Photoshop agent** that edits images from natural-language instructions, running an observe-think-act loop over 49 tools with vision grounding and a quality-critic refinement step.

Machine Learning Engineer – Adobe Inc., Bangalore, India July 2016 – August 2019

- Co-developed Adobe's production **ML prediction service**, sustaining 3,500 QPS/node at 0.3–0.6 ms app-side p99 latency (Adobe Tech Blog).
- Built an end-to-end model lifecycle platform: versioned deployment, live monitoring, and staged rollout across dev, staging, and production.

SELECTED PROJECTS

VibeNanoChat: GPT-2 Scale LLM Pretraining from Scratch 2026 | github.com/divyanshu25/VibeNanoChat
Decoder-only transformer (RoPE, RMSNorm, sliding-window attention) with one-knob depth scaling and a custom distributed **Muon** optimizer (ZeRO-2 state sharding), trained in BF16 with FlashAttention-3 on 8× H100 at over 1M tokens/sec. Fit isoFLOP curves across 40+ runs (44M to 522M parameters) to find compute-optimal model sizes.
Write-ups: Going Fast and A Lazy Engineer's Guide to Scaling Transformers.
